ABSTRACT DATA

0180 Clever Hans effect found in a widely used Alzheimer's Disease MRI dataset

Christian Tinauer, Maximilian Sackl, Stefan Ropele, Christian Langkammer

Methods - Dataset and Preprocessing

- ▶ 990 MRIs from 201 patients with probable AD; mean age= 75.1 ± 7.1 years, m/f=102/99

...propensity-logit-matched (covariates: age, sex) with...

- ▶ 990 MRIs from 159 normal controls; mean age= 75.3 ± 7.9 years, m/f=91/68

- ▶ ADNI database; <https://adni.loni.usc.edu/>

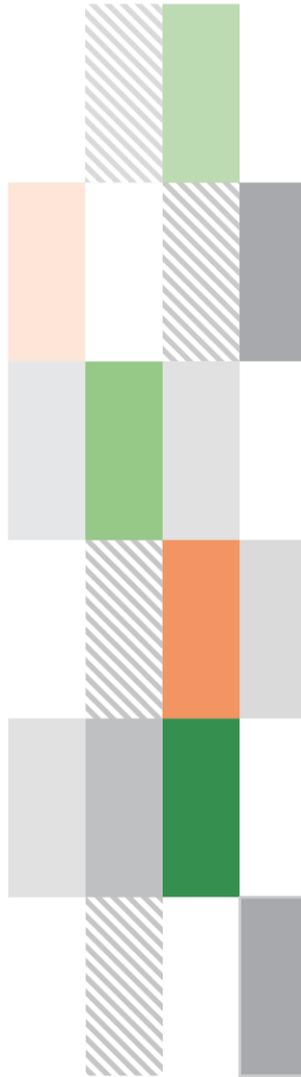

- ▶ FSL BET on T1w in native space and non-linear registration to MNI152 space

- ▶ Intensity rescaling based on white matter peak(s) in the brain tissue histogram per image

Discussion & Conclusion

- ▶ Deep learning AD classification is strongly driven by volumetric features.
- ▶ Gray-white matter texture does not improve classification performance.

Discussion & Conclusion

- ▶ Preprocessing of MR images is crucial for the feature identification by DNNs.
- ▶ The proposed relevance-guided approach identified regions with highest relevance in brain tissue located adjacent to the ventricles.
- ▶ Increased feature sparsity improves the classification accuracy.
